FUNCTIONS

WHAT IS PHP FUNCTION?

- A function is a block of code that can be executed whenever we need it.

CREATING PHP FUNCTIONS

➤ Creating PHP functions:

- All functions start with the word "function()"
- Name the function - It should be possible to understand what the function does by its name. The name can start with a letter or underscore (not a number)
- Add a "{" - The function code starts after the opening curly brace
- Insert the function code
- Add a "}" - The function is finished by a closing curly brace

EXAMPLE

A simple function that writes my name when it is called:

```
<html>
<body>
<?php
function writeMyName()
{
    echo "Kai Jim Refsnes";
}

    writeMyName();

?>
</body>
</html>
```

USE A PHP FUNCTION

```
<html>
<body>
<?php
    function writeMyName()
    {
        echo "Munirah";
    }
    echo "Hello world!<br />";
    echo "My name is ";
    writeMyName();
    echo "<br />That's right, ";
    writeMyName();
    echo " is my name.";
?>
</body>
</html>
```

OUTPUT

Hello world!

My name is Munirah.

That's right, Munirah is my name.

ADDING PARAMETERS

- Our first function (`writeMyName()`) is a very simple function. It only writes a static string.
- To add more functionality to a function, we can add parameters. A parameter is just like a variable.
- You may have noticed the parentheses after the function name, like: `writeMyName()`. The parameters are specified inside the parentheses.

EXAMPLE

The following example will write different first names, but the same last name:

```
<html>
<body>
<?php
function writeMyName($fname)
{
echo $fname . " Abdullah.<br />";
}
echo "My name is ";writeMyName("Munirah");
echo "My name is ";writeMyName("Mahirah");
echo "My name is ";writeMyName("Mardhiah");
echo "My name is ";writeMyName("Masturah");
echo "My name is ";writeMyName("Muhammad Za'im");

?>
</body>
</html>
```

OUTPUT

My name is Munirah Abdullah.

My name is Mahirah Abdullah.

My name is Mardhiah Abdullah.

My name is Masturah Abdullah.

My name is Muhammad Za'im Abdullah.

EXAMPLE ADDING TWO(2)

PARAMETERS

```
<html>
<body>
<?php
function writeMyName($fname,$punctuation)
{
echo $fname . " Abdullah" . $punctuation . "<br />";
}
echo "My name is ";writeMyName("Munirah",".");
echo "My name is ";writeMyName("Mahirah","!");
echo "My name is ";writeMyName("Mardhiah","...");
echo "My name is ";writeMyName("Masturah", "!.");
echo "My name is ";writeMyName("Muhammad Za'im",
"??");
?>
</body>
</html>
```

OUTPUT

My name is Munirah Abdullah.

My name is Mahirah Abdullah!

My name is Mardhiah Abdullah...

My name is Masturah Abdullah!..

My name is Muhammad Za'im Abdullah??

RETURN VALUES

```
<html>
<body>
<?php
    function add($x,$y)
    {
        $total = $x + $y;
        return $total;
    }
    echo "1 + 16 = " . add(1,16)
?>
</body>
</html>
```

1 + 16 = 17

Output

THE END
